PROFESSIONAL SUMMARY

Engineering leader with 14 years at Oracle, leading globally distributed engineering teams across the USA, UK, India, Mexico, and China in a remote-first operating model. I progressed through the technical ladder—from engineer to principal engineer—so I'm comfortable participating in architecture and design discussions while focusing my day-to-day work on people and delivery.

I lead hiring, 1:1s, onboarding, career development, and performance management for distributed teams that work asynchronously across multiple time zones. My management style is simple: create clarity, remove blockers, surface risks early, and give engineers the context they need to make technical decisions themselves. Recent outcomes include reducing hiring time from 11 weeks to under 5 and improving P1 resolution from 4 hours to 90 minutes.

CAREER HIGHLIGHTS

- **Ambiguity is the recurring pattern.** Inherited an ERP (financials product) team with no charter, competing stakeholder expectations, and no delivery cadence. Three months later: scope defined, SLOs set on the most visible services, and a quarterly roadmap that both product and engineering leadership could point to.
- **Built a hiring engine, then made it faster.** As hiring manager I partnered with Talent Acquisition across 25+ cycles, rewrote role criteria, rebuilt the technical assessments, and recalibrated how interview decisions get made across time zones. Time-to-offer fell from eleven weeks to under five, and the team reached full capacity two quarters ahead of plan.
- **Made a distributed team outperform what we had managed co-located.** I built the async operating model from scratch: decision logs, visible-by-default artifacts, no recurring status calls. Two adjacent teams adopted it without being asked.
- **Coached rather than directed.** Structured 1:1s around technical ownership, decision-making, and long-term growth instead of status reporting. Multiple engineers progressed into Tech Lead and first-line Engineering Manager roles, and senior ICs increasingly led architecture decisions without requiring management approval.
- **Built a high-trust feedback culture.** Led two formal performance improvement processes over several months with clear expectations, written feedback, and regular coaching. One engineer successfully met the required standard, while another transitioned respectfully; the wider team later referenced the process as the benchmark for fairness and transparency.
- **Operate as a multiplier.** During a live platform migration, engineers owned technical sequencing while I owned stakeholder alignment, delivery risk, and executive communication. The same approach later enabled an engineer-led AI tooling proposal to become a funded roadmap initiative across two platform workstreams.

CORE SKILLS

People Leadership — Remote (Global) Engineering Management | Hiring Manager & Org Planning | Psychological Safety & Feedback Culture | Career Development & Performance Management | Coaching & Mentoring Senior Engineers

Delivery & Reliability — Roadmap Ownership | Engineering Intake & Prioritisation | SLO & Incident Management | Blameless Postmortems | CI/CD & Release Governance

Technical Leadership — Cloud Infrastructure | Distributed Backend Systems | SaaS Platform Engineering | Developer-facing APIs | Relational Databases (Oracle SQL) | Architecture Reviews

PROFESSIONAL EXPERIENCE

Engineering Manager — Cloud Infrastructure

2023 – Present

Oracle Corporation

- Own the roadmap and delivery cadence: monthly milestones, weekly written stakeholder updates. Cross-functional partners got a reliable delivery signal for the first time, and mid-sprint scope changes fell by more than half.
- Run the full people cycle (1:1s, onboarding, career development, leave planning, and performance management) for a team whose working days barely overlap. Feedback is expected in both directions, documented in writing, and discussed early rather than waiting for formal reviews.
- Set up the on-call rotation and incident response framework for multi-region services, with runbooks and blameless post-incident review templates. Coordinated P1 production incidents end to end: cross-functional response, stakeholder communication, the review afterwards. MTTR went from four hours to under ninety minutes, and customer escalations dropped the following quarter.
- Redesigned the hiring loop as hiring manager with Talent Acquisition: role criteria, assessments, interviewer calibration. Across twelve open roles, time-to-offer went from eleven weeks to under six.

- Facilitated weekly architecture reviews where senior ICs challenged designs, proposed platform improvements, and reviewed trade-offs together. My role was to raise engineering quality and create alignment—not to be the primary technical voice in the room.
- Removed organisational blockers by resolving competing stakeholder requests, clarifying ownership, and connecting engineers with the right context. Engineers retained full ownership of implementation decisions and technical execution.
- Handled two performance improvement situations with direct, documented feedback over several months. Transparent throughout, including the harder parts; the wider team later referenced the process in retros.

Technical Program Manager — Cloud Platform Delivery

2020 – 2022

Oracle Corporation

- Led delivery planning across four cross-functional engineering teams responsible for shared cloud platform services, managing dependencies, milestones, and production readiness.
- Found a dependency between two geographically separated teams that had been invisible to both sets of stakeholders for over a quarter. Fixing it early avoided roughly six weeks of rework and protected a flagship customer milestone.
- Built the async operating model when the programme went fully distributed in 2020: rituals, decision logs, escalation paths across three time zones. Delivery held schedule without adding a single meeting.
- Owned the engineering intake process for cross-team requests, deciding what was prioritised, routed, deferred, or pushed back while protecting the team's roadmap from unplanned work.
- Spotted a scope-creep pattern costing two to three weeks per sprint, built a change-control process around it, and brought delivery accuracy within one week of commitment in the two cycles that followed.

Principal Engineer — Cloud Applications Engineering

2017 – 2020

Oracle Corporation

- Designed the service decomposition for a monolith-to-microservices migration; teams shipped services independently instead of coordinating full-platform releases.
- Designed developer-facing integration APIs and relational data models for a workforce platform used by internal product teams and integration partners, balancing platform consistency with the needs of API consumers.
- Found a systemic gap in performance testing for high-throughput transactional workloads and proposed a targeted test suite. Coverage tripled in one cycle, and release-blocking defects in that category fell to near zero over the next two quarters.
- Specified a cross-region data synchronisation feature for regulated markets; it was implemented with zero architectural revisions. Also pushed early AI-assisted review and defect triage so the team spent its hours on design rather than ceremony.

Technical Lead — Enterprise Applications

2014 – 2017

Oracle Corporation

- Led a five-person team on a high-priority platform feature; velocity held through a mid-cycle headcount change. Several engineers from this group went on to senior and lead roles.
- Root-caused a race condition in a payroll batch engine that had been open two sprints; eliminated a category of customer-side reconciliation errors.
- Cut batch payroll run time from six hours to under two, closing an escalation open for over a year. Built a PR review checklist that cut average review rounds from three to under two.

Senior Application/Application Engineer

2010 – 2014

Oracle Corporation

- Delivered backend for a financial reporting module across twelve countries; largest-dataset report generation fell from twenty minutes to under four.
- Wrote automated regression tests for a payroll integration previously tested manually — caught four issues before UAT in six months.
- Resolved a data consistency defect in a payroll calculation engine and built the team's early automated testing practices as the product scaled to multi-region delivery.

CERTIFICATIONS

- AWS Certified Solutions Architect – Associate
- Oracle Cloud Infrastructure 2024 Certified Architect Professional
- ITIL 4 Foundation

EDUCATION

Bachelor of Engineering - Pd. Ravi Shankar Shukla University (India)
